Q1

1.1. For
$$\mathbf{a}=\begin{pmatrix} 6\\3\\4 \end{pmatrix}$$
 and $\mathbf{b}=\begin{pmatrix} 1\\4\\2 \end{pmatrix}$, the scalar product is $\mathbf{a}\cdot\mathbf{b}=26.$

1.2. For
$$\mathbf{a} = \begin{pmatrix} 10 \\ -7 \\ 4 \end{pmatrix}$$
 and $\mathbf{b} = \begin{pmatrix} 3 \\ -5 \\ 13 \end{pmatrix}$, the scalar product is $\mathbf{a} \cdot \mathbf{b} = 117$.

1.3. For
$$\mathbf{a}=\begin{pmatrix} -44\\-12\\3 \end{pmatrix}$$
 and $\mathbf{b}=\begin{pmatrix} 61\\-25\\93 \end{pmatrix}$, the scalar product is $\mathbf{a}\cdot\mathbf{b}=-2237.$

1.4. For
$$\mathbf{a}=\begin{pmatrix}54\\38\\0\end{pmatrix}$$
 and $\mathbf{b}=\begin{pmatrix}32\\-55\\13\end{pmatrix}$, the scalar product is $\mathbf{a}\cdot\mathbf{b}=-362.$

1.5. For $\mathbf{a} = 2\mathbf{i} + 7\mathbf{j} + \mathbf{k}$ and $\mathbf{b} = 6\mathbf{i} + 4\mathbf{j} + 8\mathbf{k}$, the scalar product is $\mathbf{a} \cdot \mathbf{b} = 48$.

1.6. For
$$\mathbf{a} = -3\mathbf{i} + 10\mathbf{j} - 8\mathbf{k}$$
 and $\mathbf{b} = \mathbf{i} - 12\mathbf{j} + 9\mathbf{k}$, the scalar product is $\mathbf{a} \cdot \mathbf{b} = -195$.

1.7. For
$$\mathbf{a} = 17\mathbf{j} + 23\mathbf{k}$$
 and $\mathbf{b} = 6\mathbf{i} - 23\mathbf{j} - 8\mathbf{k}$, the scalar product is $\mathbf{a} \cdot \mathbf{b} = -575$.

1.8. For $\mathbf{a} = \mathbf{i}$ and $\mathbf{b} = \mathbf{j}$, the scalar product is $\mathbf{a} \cdot \mathbf{b} = 0$.

As the scalar product of $\mathbf{a} = \mathbf{i}$ and $\mathbf{b} = \mathbf{j}$ is 0, they are perpendicular to each other. This is true for any combination of any distinct pair of \mathbf{i} , \mathbf{j} , and \mathbf{k} . However, since any vector is parallel to itself, it follows that $\mathbf{i} \cdot \mathbf{i} = |\mathbf{i}| |\mathbf{i}| = |1| |1| = 1$; similar results hold for $\mathbf{j} \cdot \mathbf{j}$ and $\mathbf{k} \cdot \mathbf{k}$.
