Proof: properties of sigma notation

Tom Coleman

Summary

An explanation as to why some of the properties of sigma notation are true.

Before reading this proof sheet, it is recommended that you read Guide: Introduction to sigma notation *and [Guide: Proof by induction].*

Proof of properties of sigma notation

Distributivity

> **i** Distributivity
>
> Hello

> **i** Proof of distributivity
>
> You can see this is true by writing the entire sum out, like this:
>
> $$\begin{aligned} \sum_{i=k}^{n} Ca_i &= Ca_k + Ca_{k+1} + Ca_{k+2} + ... + Ca_n \\ &= C(a_k + a_{k+1} + a_{k+2} + ... + a_n) \\ &= C \sum_{i=k}^{n} a_k \end{aligned}$$

Combining and decomposing sums

> **i** Combining and decomposing sums
>
> Hello

> **i** Proof of combining and decomposing sums
>
> Similar to the distributive property, you can show this is true by writing the entire sum out:

$$\begin{aligned}
\sum_{i=k}^{n} a_i + \sum_{i=k}^{n} b_i &= (a_k + a_{k+1} + ... + a_n) + (b_k + b_{k+1} + ... + b_n) \\
&= (a_k + b_k) + (a_{k+1} + b_{k+1}) + ... + (a_n + b_n) \\
&= \sum_{i=k}^{n} (a_k + b_k).
\end{aligned}$$

In a similar way, you can show that $\sum_{i=k}^{n} a_i - \sum_{i=k}^{n} b_i = \sum_{i=k}^{n} (a_i - b_i)$ is also true.
